

Wildlife Disease

The Wildlife Disease Information Node is a collaborative project working to develop a Web-based monitoring and reporting system to provide state and federal resource managers, animal disease specialists, veterinary diagnostic laboratories, physicians, public health workers, educators, and the general public with access to data on wildlife diseases, mortality events, and other critical related information. Data are contributed voluntarily, with partners deciding which data they choose to share.

Across

1. harmful, unnatural substance in the environment
2. animals with fur
5. disease transmitted by ticks
10. bird flu
13. 8-legged parasite
15. trout or bass
